

# Exercises in System Level Programming (SLP) – Summer Term 2025

---

## Exercise 7

Maxim Ritter von Onciul  
Eva Dengler

Lehrstuhl für Informatik 4  
Friedrich-Alexander-Universität Erlangen-Nürnberg

Lehrstuhl für Informatik 4  
Systemsoftware

Friedrich-Alexander-Universität  
Faculty of Engineering

## **Presentation Assignment 4**

---

# Hands-on: Coffee Machine

Screencast: <https://www.video.uni-erlangen.de/clip/id/17647>

- Learning goals:
  - Finite state machines
  - Timers and alarms
  - Interrupts & sleep modes

## ■ Wiring:

- Pump & heating: Port D, Pin 5 (active-low)
- Button: INT0 an Port D, Pin 2 (active-low)
- Sensor: INT1 an Port D, Pin 3 (water: high; no water: low)
- State LED:
  - BLUE0: **STANDBY**
  - GREEN0: **ACTIVE**
  - RED0: **NO\_WATER**

### STANDBY

- Machine is switched off
- Pump and heating are off
- User can start making coffee by pressing the button
- Initial state

### ACTIVE

- Machine is switched on
- Pump and heating are on
- Water tank is not empty
- User can stop the machine by pressing the button

### NO\_WATER

- Coffee machine shows that not enough water is in the tank
- Pump and heating are off
- Time period: 2 seconds

### ■ Hints:

- Pressed button & change of water level by interrupts
- State LED: `void setLEDState(state_t state)`
- Waiting phases can be implemented using the single-shot alarms
- During waiting phases always enter a power-saving mode

**DDRx** Configuration of pin  $i$  of port  $x$  as in-/output

- Bit  $i = 1 \rightarrow$  Pin  $i$  as output
- Bit  $i = 0 \rightarrow$  Pin  $i$  as input

**PORTx** Mode of operation **depends on DDRx**:

- If pin  $i$  is **configured as output**, then bit  $i$  in the PORTx register controls whether a high level or a low level has to be generated at pin  $i$ 
  - Bit  $i = 1 \rightarrow$  high level at pin  $i$
  - Bit  $i = 0 \rightarrow$  low level at pin  $i$
- If pin  $i$  is **configured as input**, then the internal pull-up resistor can be activated
  - Bit  $i = 1 \rightarrow$  pull-up resistor at pin  $i$  (level is pulled high)
  - Bit  $i = 0 \rightarrow$  pin  $i$  configured as tri-state

**PINx** Bit  $i$  returns the current level of pin  $i$  at port  $x$  (read only)

- Interrupt sense control (ISC) bits of the ATmega328PB are located at the external interrupt control register A (EICRA)
- Position of the ISC-bits inside the register defined by macros

| Interrupt INT0 |       | Interrupt on | Interrupt INT1 |       |
|----------------|-------|--------------|----------------|-------|
| ISC01          | ISC00 |              | ISC11          | ISC10 |
| 0              | 0     | low level    | 0              | 0     |
| 0              | 1     | either edge  | 0              | 1     |
| 1              | 0     | falling edge | 1              | 0     |
| 1              | 1     | rising edge  | 1              | 1     |

- ATmega328PB: External interrupt mask register (EIMSK)
- The position of the bits in this register is also defined by macros INTn

## Hands-on: Ticker

- char: Single character (e.g. 'a')
- String: Array of chars (e.g. "Hello")
- C: Last char of a string: '\0'  
⇒ Memory requirement:  $\text{strlen}(s) + 1$

```
01 char s[] = "World\n";  
02 char c = s[0];  
03 c = s[4];  
04 char *s2 = s + 2;  
05 c = s2[1];
```

- char: Single character (e.g. 'a')

04 char *s2 = s + 2;  
05 c = s2[1];
```

- **Functionality:**  
Displaying a text step-by-step on the 7-segment display
- **Learning goals:**
  - Strings in C
  - Pointers & pointer arithmetic
  - Alarms & sleep modes
- **Procedure:**
  - Recurring alarms with `TIMER0`
  - Combining the current substring
  - Output via the 7-segment display
  - During waiting phases, the microcontroller has to enter a sleep mode (passive waiting)

```
01 const char *string = "HELLO SPIC";
02 const char *current = string;
03 // current[0] == 'H' && current[1] == 'E'
04 ++current;
05 // current[0] == 'E' && current[1] == 'L'
06 // [...]
07 // current[0] == '\0', current[1] == ??
08 current = string;
```

```
01 const char *string = "HELLO SPIC";  
02 const char *current = string;  
03 // current[0] == 'H' && current[1] == 'E'  
04 ++current;
