opendir/readdir(3)

stat(2)

NAME

opendir - open a directory / readdir - read a directory

SYNOPSIS

#include <sys/types.h>

#include <dirent.h>

DIR *opendir(**const char ****name*);

struct dirent *readdir(DIR *dir);

DESCRIPTION opendir

The **opendir**() function opens a directory stream corresponding to the directory *name*, and returns a pointer to the directory stream. The stream is positioned at the first entry in the directory.

RETURN VALUE

The opendir() function returns a pointer to the directory stream or NULL if an error occurred.

DESCRIPTION readdir

The **readdir**() function returns a pointer to a dirent structure representing the next directory entry in the directory stream pointed to by *dir*. It returns NULL on reaching the end-of-file or if an error occurred.

The data returned by **readdir()** is overwritten by subsequent calls to **readdir()** for the same directory stream.

The *dirent* structure is defined as follows:

```
struct dirent {
```

```
long
d_ino;
/* inode number */

off_t
d_off;
/* offset to the next dirent */

unsigned short
d_reclen;
/* length of this record */

unsigned char
d_type;
/* type of file */

char
d_name[256];
/* filename */
```

RETURN VALUE

The **readdir**() function returns a pointer to a dirent structure, or NULL if an error occurs or end-of-file is reached.

ERRORS

EACCES

};

Permission denied.

EMFILE

Too many file descriptors in use by process.

ENFILE

Too many files are currently open in the system.

ENOENT

Directory does not exist, or name is an empty string.

ENOMEM

Insufficient memory to complete the operation.

ENOTDIR

name is not a directory.

NAME

stat, lstat – get file status

SYNOPSIS

#include <sys/types.h> #include <sys/stat.h> #include <unistd.h>

int stat(const char * file_name, struct stat *buf); int lstat(const char * file_name, struct stat *buf);

DESCRIPTION

These functions return information about the specified file. You do not need any access rights to the file to get this information but you need search rights to all directories named in the path leading to the file.

stat stats the file pointed to by file_name and fills in buf.

lstat is identical to **stat**, except in the case of a symbolic link, where the link itself is stat-ed, not the file that it refers to.

They all return a stat structure, which contains the following fields:

st_dev; /* device */
st_ino; /* inode */
st_mode; /* protection */
st_nlink; /* number of hard links */
st_uid; /* user ID of owner */
st_gid; /* group ID of owner */
st_rdev; /* device type (if inode device) */
st_size; /* total size, in bytes */
st_blksize; /* blocksize for filesystem I/O */
st_blocks; /* number of blocks allocated */
st_atime; /* time of last access */
st_mtime; /* time of last modification */
st_ctime; /* time of last status change */

}:

The value *st_size* gives the size of the file (if it is a regular file or a symlink) in bytes. The size of a symlink is the length of the pathname it contains, without trailing NUL.

Not all of the Linux filesystems implement all of the time fields. Some file system types allow mounting in such a way that file accesses do not cause an update of the st_atime field. (See 'noatime' in **mount**(8).)

The field *st_atime* is changed by file accesses, e.g. by **execve**(2), **mknod**(2), **pipe**(2), **utime**(2) and **read**(2) (of more than zero bytes). Other routines, like **mmap**(2), may or may not update *st_atime*.

The field *st_mtime* is changed by file modifications, e.g. by **mknod**(2), **truncate**(2), **utime**(2) and **write**(2) (of more than zero bytes). Moreover, *st_mtime* of a directory is changed by the creation or deletion of files in that directory. The *st_mtime* field is *not* changed for changes in owner, group, hard link count, or mode.

The field st_ctime is changed by writing or by setting inode information (i.e., owner, group, link count, mode, etc.).

RETURN VALUE

On success, zero is returned. On error, -1 is returned, and errno is set appropriately.
